Re: MRI Referral for Patient: **Leila Al Mansouri**

DOB: 14/06/1991

MRN: 20250815-ALM

Dear Radiology Team,

I am referring Ms. Leila Al Mansouri for an **MRI of the left knee (CPT 73721)**.

Clinical Summary:

The patient presents with persistent left knee pain for over 6 weeks, associated with swelling, limited range of motion, and functional impairment. On examination, there is joint line tenderness and restricted flexion, raising suspicion for meniscal pathology or cartilage injury.

Reason for MRI:

Advanced imaging is required to:

- Evaluate meniscal integrity and detect possible tears
- Assess cartilage and ligament structures
- Rule out internal derangements or occult injuries not visible on plain radiographs

Urgency:

Prompt MRI is recommended to prevent delay in diagnosis and treatment, which could otherwise worsen the patient's condition and prolong disability.

Please proceed with the MRI as soon as scheduling allows.

Thank you for your support.

Sincerely,

Dr. Aisha Al Qubaisi

Consultant Orthopaedic Surgeon
